Autism spectrum disorder (ASD) is a complex developmental condition that involves persistent challenges in social interaction, speech and nonverbal communication, and restricted/repetitive behaviors. The effects of ASD and the severity of symptoms are different in each person. ASD is usually first diagnosed in childhood with many of the most-obvious signs presenting around 2-3 years old, but some children with autism develop normally until toddlerhood when they stop acquiring or lose previously gained skills. Autism spectrum, also known as autism spectrum disorder (ASD), describes a range of conditions classified as neurodevelopmental disorders in the DSM-5, published in 2013. Individuals diagnosed with autism spectrum disorder must present two types of symptoms: Deficits in social communication and social interaction. Restricted, repetitive patterns of behavior, interests or activities.
