Historical Development and Perspectives of the Series

Metal Ions in Life Sciences

It is an old wisdom that metals are indispensable for life. Indeed, several of them, like sodium, potassium, and calcium, are easily discovered in living matter. However, the role of metals and their impact on life remained largely hidden until inorganic chemistry and coordination chemistry experienced a pronounced revival in the 1950s. The experimental and theoretical tools created in this period and their application to biochemical problems led to the development of the field or discipline now known as *Bioinorganic Chemistry*, *Inorganic Biochemistry*, or more recently also often addressed as *Biological Inorganic Chemistry*.

By 1970 *Bioinorganic Chemistry* was established and further promoted by the book series *Metal Ions in Biological Systems* founded in 1973 (edited by H.S., who was soon joined by A.S.) and published by Marcel Dekker, Inc., New York, for more than 30 years. After this company ceased to be a family endeavor and its acquisition by another company, we decided, after having edited 44 volumes of the MIBS series (the last two together with R.K.O.S.) to launch a new and broader minded series to cover today's needs in the *Life Sciences*. Therefore, the Sigels' new series is entitled

Metal Ions in Life Sciences

and we are happy to join forces in this new endeavor with a most experienced Publisher in the *Sciences*, John Wiley & Sons, Ltd., Chichester, UK.

The development of *Biological Inorganic Chemistry* during the past 40 years was and still is driven by several factors; among these are (i) the attempts to reveal the interplay between metal ions and peptides, nucleotides, hormones or vitamins, etc., (ii) the efforts regarding the understanding of accumulation, transport, metabolism and toxicity of metal ions, (iii) the development and application of metal-based drugs, (iv) biomimetic syntheses with the aim to understand biological processes as well as to create efficient catalysts, (v) the determination of high-resolution structures of proteins, nucleic acids, and other biomolecules, (vi) the utilization of powerful spectroscopic tools allowing studies of structures and dynamics, and (vii), more recently, the widespread use of macromolecular

engineering to create new biologically relevant structures at will. All this and more is and will be reflected in the volumes of the series *Metal Ions in Life Sciences*.

The importance of metal ions to the vital functions of living organisms, hence, to their health and well-being, is nowadays well accepted. However, in spite of all the progress made, we are still only at the brink of understanding these processes. Therefore, the series *Metal Ions in Life Sciences* will endeavor to link coordination chemistry and biochemistry in their widest sense. Despite the evident expectation that a great deal of future outstanding discoveries will be made in the interdisciplinary areas of science, there are still “language” barriers between the historically separate spheres of chemistry, biology, medicine, and physics. Thus, it is one of the aims of this series to catalyze mutual “understanding”.

It is our hope that *Metal Ions in Life Sciences* proves a stimulus for new activities in the fascinating “field” of *Biological Inorganic Chemistry*. If so, it will well serve its purpose and be a rewarding result for the efforts spent by the authors.

Preface to Volume 4

Biom mineralization.

From Nature to Application

This volume is solely devoted to the vibrant research area around *Biom mineralization*. The introductory chapter “Crystals and Life” sets the scene for the book. The “bio” in the term biomineral implies that the high activation energy (extreme temperature, pressure, etc.) commonly involved in mineral formation by strictly inorganic chemical means is bypassed by the intervention of biopolymers which alter the crystallization reaction pathways. Silicate minerals are most abundant but are restricted in the sense that the majority of silica biochemistry and biogenic siliceous mineral formation takes place in the oceans. The carbonate and phosphate cycles are more prominent in the terrestrial portion of the earth’s surface as is also evidenced in several chapters of this book.

The interrelation between genes or genomes and biomineralization, as exemplified with calcium carbonate, and the role of enzymes in biomineralization processes are covered in Chapters 2 and 3. The ubiquity of prokaryotes (comprised of ‘bacterial’ and ‘archeal’ domains) is unparalleled in nature as pointed out in Chapter 4. These remarkable organisms have a metabolic plasticity and tolerance to extremes far greater than any other life form so that they are able to thrive in almost any terrestrial environment imaginable. They may form ‘biofilms’, i.e., matrix-covered bacterial populations that exhibit complex physico-chemical and physiological characteristics, which differ in their properties from planktonic cells in the overlying aqueous phase – and, yes, the biomineralization capacity of these minute creatures can have global effects!

Organisms exercise control over their mineral parts with great fidelity. So far over 60 different minerals are identified in all five kingdoms, calcium being the main, but not only, cation in biogenic minerals. This is evident from Chapters 5 to 7 where properties of carbonate, sulfate, and oxalate biominerals are summarized. The next chapter describes biosilicification processes in diatoms. These unicellular eukaryotic microalgae have emerged as a model organism for studying composites of organic material and nanostructured silica.

Chapter 9 is devoted to invertebrate tooth tissues containing large quantities of heavy metals for structural purposes. Examples include iron mineralized mollusk teeth, marine worm jaws with copper and zinc, or arthropod mandibles enriched with zinc and manganese. The next two chapters deal with biominerals in ferritins, which consist of nanoparticles formed by hydrated ferric oxide, and magnetotactic bacteria; these use magnetite or greigite in their magnetosomes which allow them to align and migrate along geomagnetic field lines, whereby each cell behaves as a self-propelled magnetic compass needle. Chapter 12 considers to what extent (bio)minerals are recorders of the past. This is a difficult question still open for debate because the role of bacteria in ancient geological formations, such as banded iron formations, is hard to establish since organic templates are rarely preserved, but even so, one is tempted to say yes.

The dynamics of biomineralization and biodemineralization are summarized in Chapter 13, the biodemineralization reactions being discussed for tooth enamel and bone. The skeleton of mammals and other vertebrates consists of a mineral phase (an analog of the geologic mineral hydroxyapatite) and an organic phase (principally collagen). Thus, Chapter 14 describes the mineralization mechanism of collagen-based connective tissues and the following one deals with mammalian enamel formation, enamel, a hard bioceramic, being the outermost cover of teeth.

Mineralized tissues such as bone, teeth, shells or glass sponges fulfill the mechanical functions of support or protection. As a consequence, these materials need to be very fracture-resistant and are therefore an ideal subject of study for biomimetic materials research as shown in Chapter 16. Similarly, the bioinspired growth of mineralized tissue, i.e., tissue engineering, the topic of Chapter 17, is an emerging discipline focused on generating tissue replacements using combinations of cells, biological molecules and materials. The terminating Chapter 18 deals with the controlled synthesis of inorganic crystals or hybrid organic-inorganic materials with specific size, shape, orientation, etc., and their incorporation into a structural hierarchy. With such building blocks new materials and devices can be designed for potential applications in diverse fields such as catalysis, medicine, electronics, ceramics or cosmetics.

References	322
10 FERRITIN. BIOMINERALIZATION OF IRON	327
<i>Elizabeth C. Theil, Xiaofeng S. Liu, and Manolis Matzapetakis</i>	
Abstract	327
1. Introduction	328
2. Protein Nanocage Structures	329
3. Iron Entry: The Protein Ferroxidase Site	330
4. Mineral Precursor Translocation, Nucleation, and Mineralization	334
5. Ferritin Demineralization and the Nanocage Gated Pores	334
6. Summary and Perspective	336
Acknowledgments	337
Abbreviations and Definitions	338
References	338
11 MAGNETISM AND MOLECULAR BIOLOGY OF MAGNETIC IRON MINERALS IN BACTERIA	343
<i>Richard B. Frankel, Sabrina Schübbe, and Dennis A. Bazylinski</i>	
Abstract	344
1. Introduction. Magnetotactic Bacteria	344
2. Molecular Biology of Magnetosome Chain Formation	353

3. Magnetic Properties of Magnetosomes	359
4. Conclusions	371
Acknowledgments	372
Abbreviations	372
References	372
12 BIOMINERALS. RECORDERS OF THE PAST?	377
<i>Danielle Fortin, Sean Langley, and Susan Glasauer</i>	
Abstract	378
1. Introduction	378
2. What Are Biominerals?	380
3. Biominerals as Biosignatures?	389
4. Tools to Study Biosignatures	398
5. General Conclusions	404
Acknowledgments	405
Abbreviations	405
References	406
13 DYNAMICS OF BIOMINERALIZATION AND BIODEMINERALIZATION	413
<i>Lijun Wang and George H. Nancollas</i>	
Abstract	414
1. Introduction	414
2. Nucleation and Crystal Growth	415
3. Dissolution	437
4. Conclusion and Future Directions	448
Acknowledgments	450
Abbreviations and Definitions	450
List of Symbols	451
References	452
14 MECHANISM OF MINERALIZATION OF COLLAGEN-BASED CONNECTIVE TISSUES	457
<i>Adele L. Boskey</i>	
Abstract	458
1. Introduction	458
2. Function of Collagen in the Regulation of Vertebrate Biomineralization	472
3. Comparative Composition of the Organic Components of Collagenous Mineralized Tissues	475
4. Is there a Uniform Theory of Vertebrate Mineralization?	489
Acknowledgments	492
Abbreviations	493
References	494

Metal Ions in Life Sciences links coordination chemistry and biochemistry in their widest sense and thus increases our understanding of the relationship between the chemistry of metals and life processes. The series reflects the interdisciplinary nature of Biological Inorganic Chemistry and coordinates the efforts of scientists in fields like biochemistry, inorganic chemistry, coordination chemistry, molecular and structural biology, enzymology, environmental chemistry, physiology, toxicology, biophysics, pharmacy, and medicine. Consequently, the volumes are an essential source for researchers Metal Ions in Life Sciences Vol. 5. Edited by Astrid Sigel, Helmut Sigel and Roland K. O. Sigel. prev. next. The general format of these chapters is to review the literature regarding the structure, function, and gene organization/regulation of the species-specific MT with comparison to the most well-studied mammalian MTs as a point of reference. Chapters 11-13 wrap up the metallothionein portion of the book with the focused topics of brain-specific mammalian isoform MT-3, the function of metallothionein in metal-ion Metallothioneins and Related Chelators Metal Ions in Life Sciences Vol. 5. Edited by Astrid Sigel, Helmut Sigel and Roland K. O. Sigel.

New & Forthcoming Titles | Metal Ions in Life Sciences. New & Forthcoming Titles. Home > New & Forthcoming Titles.Â The series reflects the interdisciplinary nature of Biological Inorganic Chemistry and coordinates the efforts of scientists in fields like biochemistry, inorganic chemistry, coordination chemistry, molecular and structural biology, enzymology, environmental chemistry, physiology, toxicology, biophysics, pharmacy, and medicine. Consequently, the volumes are an essential source for researchers active in these fields as well as teachers preparing courses, e.g. in Bioinorganic Chemistry. For more information on this book series, please also visit: http://en.wikipedia.org/wiki/Metal_Ions_in_Life_S... "Metal Ions in Biological Systems" was begun three years later by Helmut Sigel and subsequently his wife Astrid, both at the University of Basel. The series was published by Marcel Dekker. Over a period of somewhat more than 30 years 44 volumes were published. Their son Roland Sigel, at the University of Zurich, was also involved in the last two volumes. In 2004 Dekker has been taken over by Taylor and Francis.[2]. The Sigels then launched a new series entitled "Metal Ions in Life Sciences". The first four volumes were published by John Wiley & Sons.[3] From 2009 the se
